

KRISHI AI ADVISOR

Week 5 CRUD Persistence Verification Report

Project: Krishi AI Advisor (Uttarakhand Organic Agronomy)

Version: Week 5 (MongoDB Atlas + Mongoose Migration)

Supervisory Area: Mandakini Organic Collective

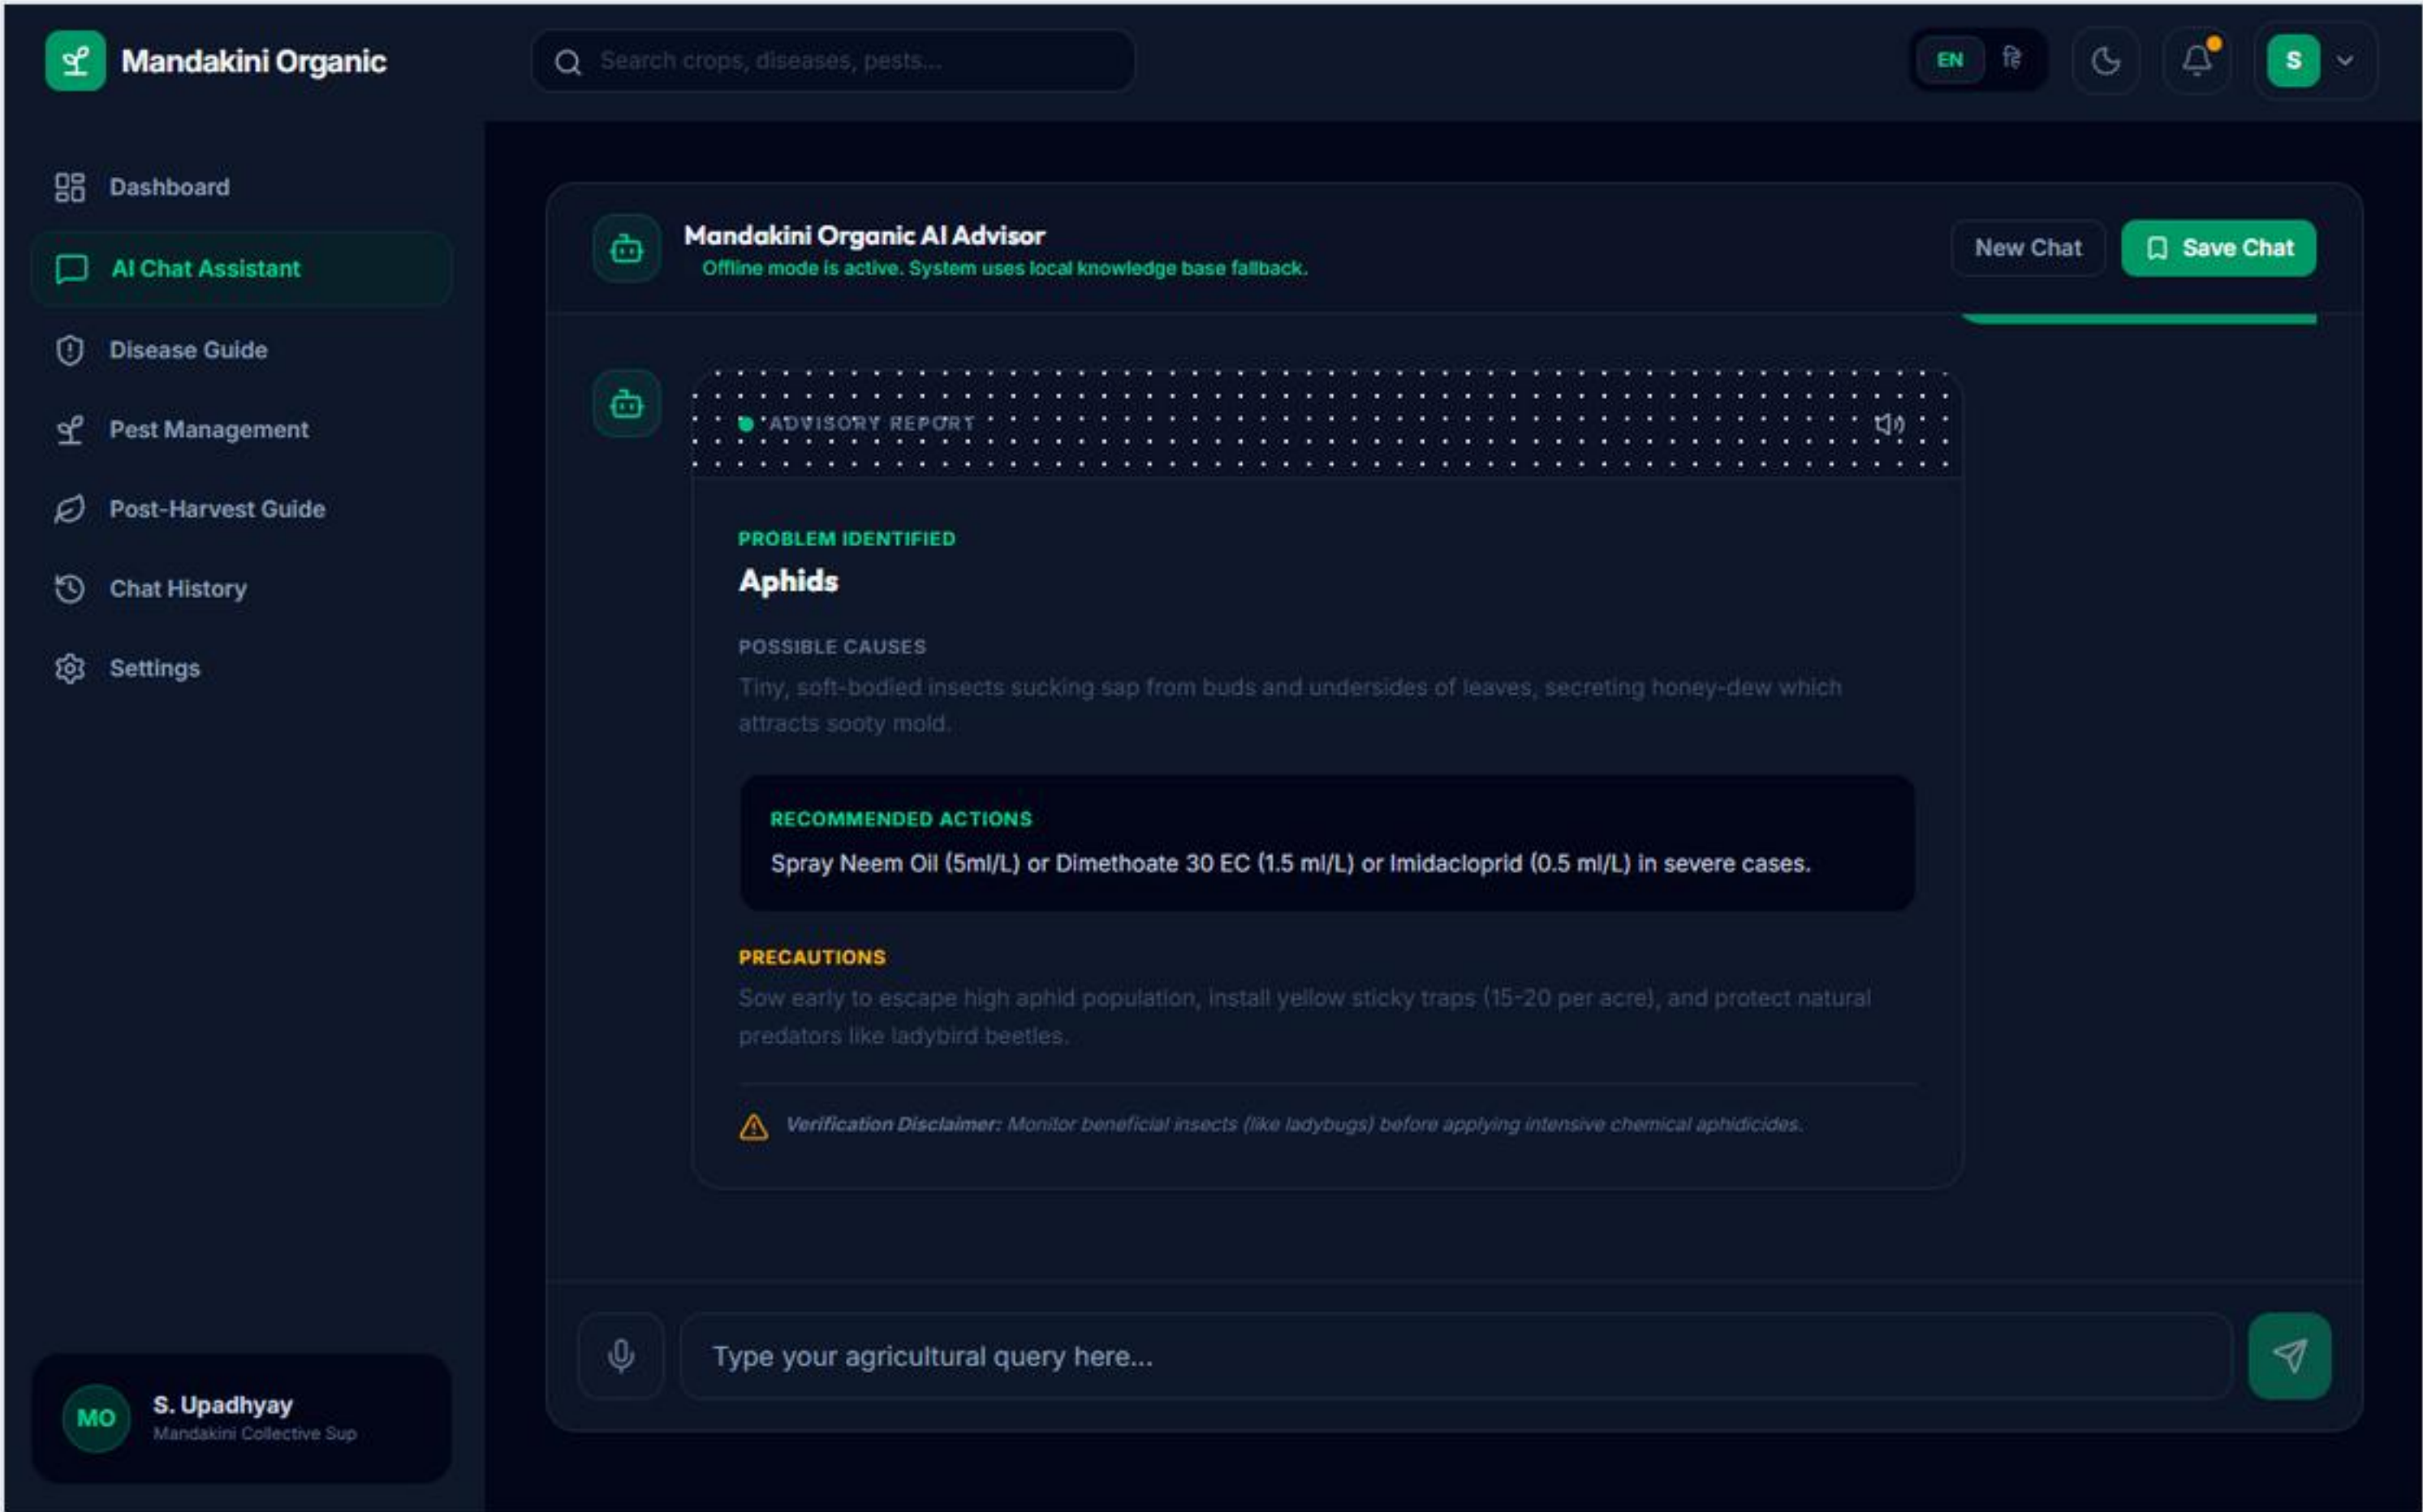

Author: Suresh Upadhyay (Collective Supervisor)

Date: July 05, 2026

Verification ID: TBI-26100505

OS Environment: Windows 11 HEADLESS-CHROME CDP

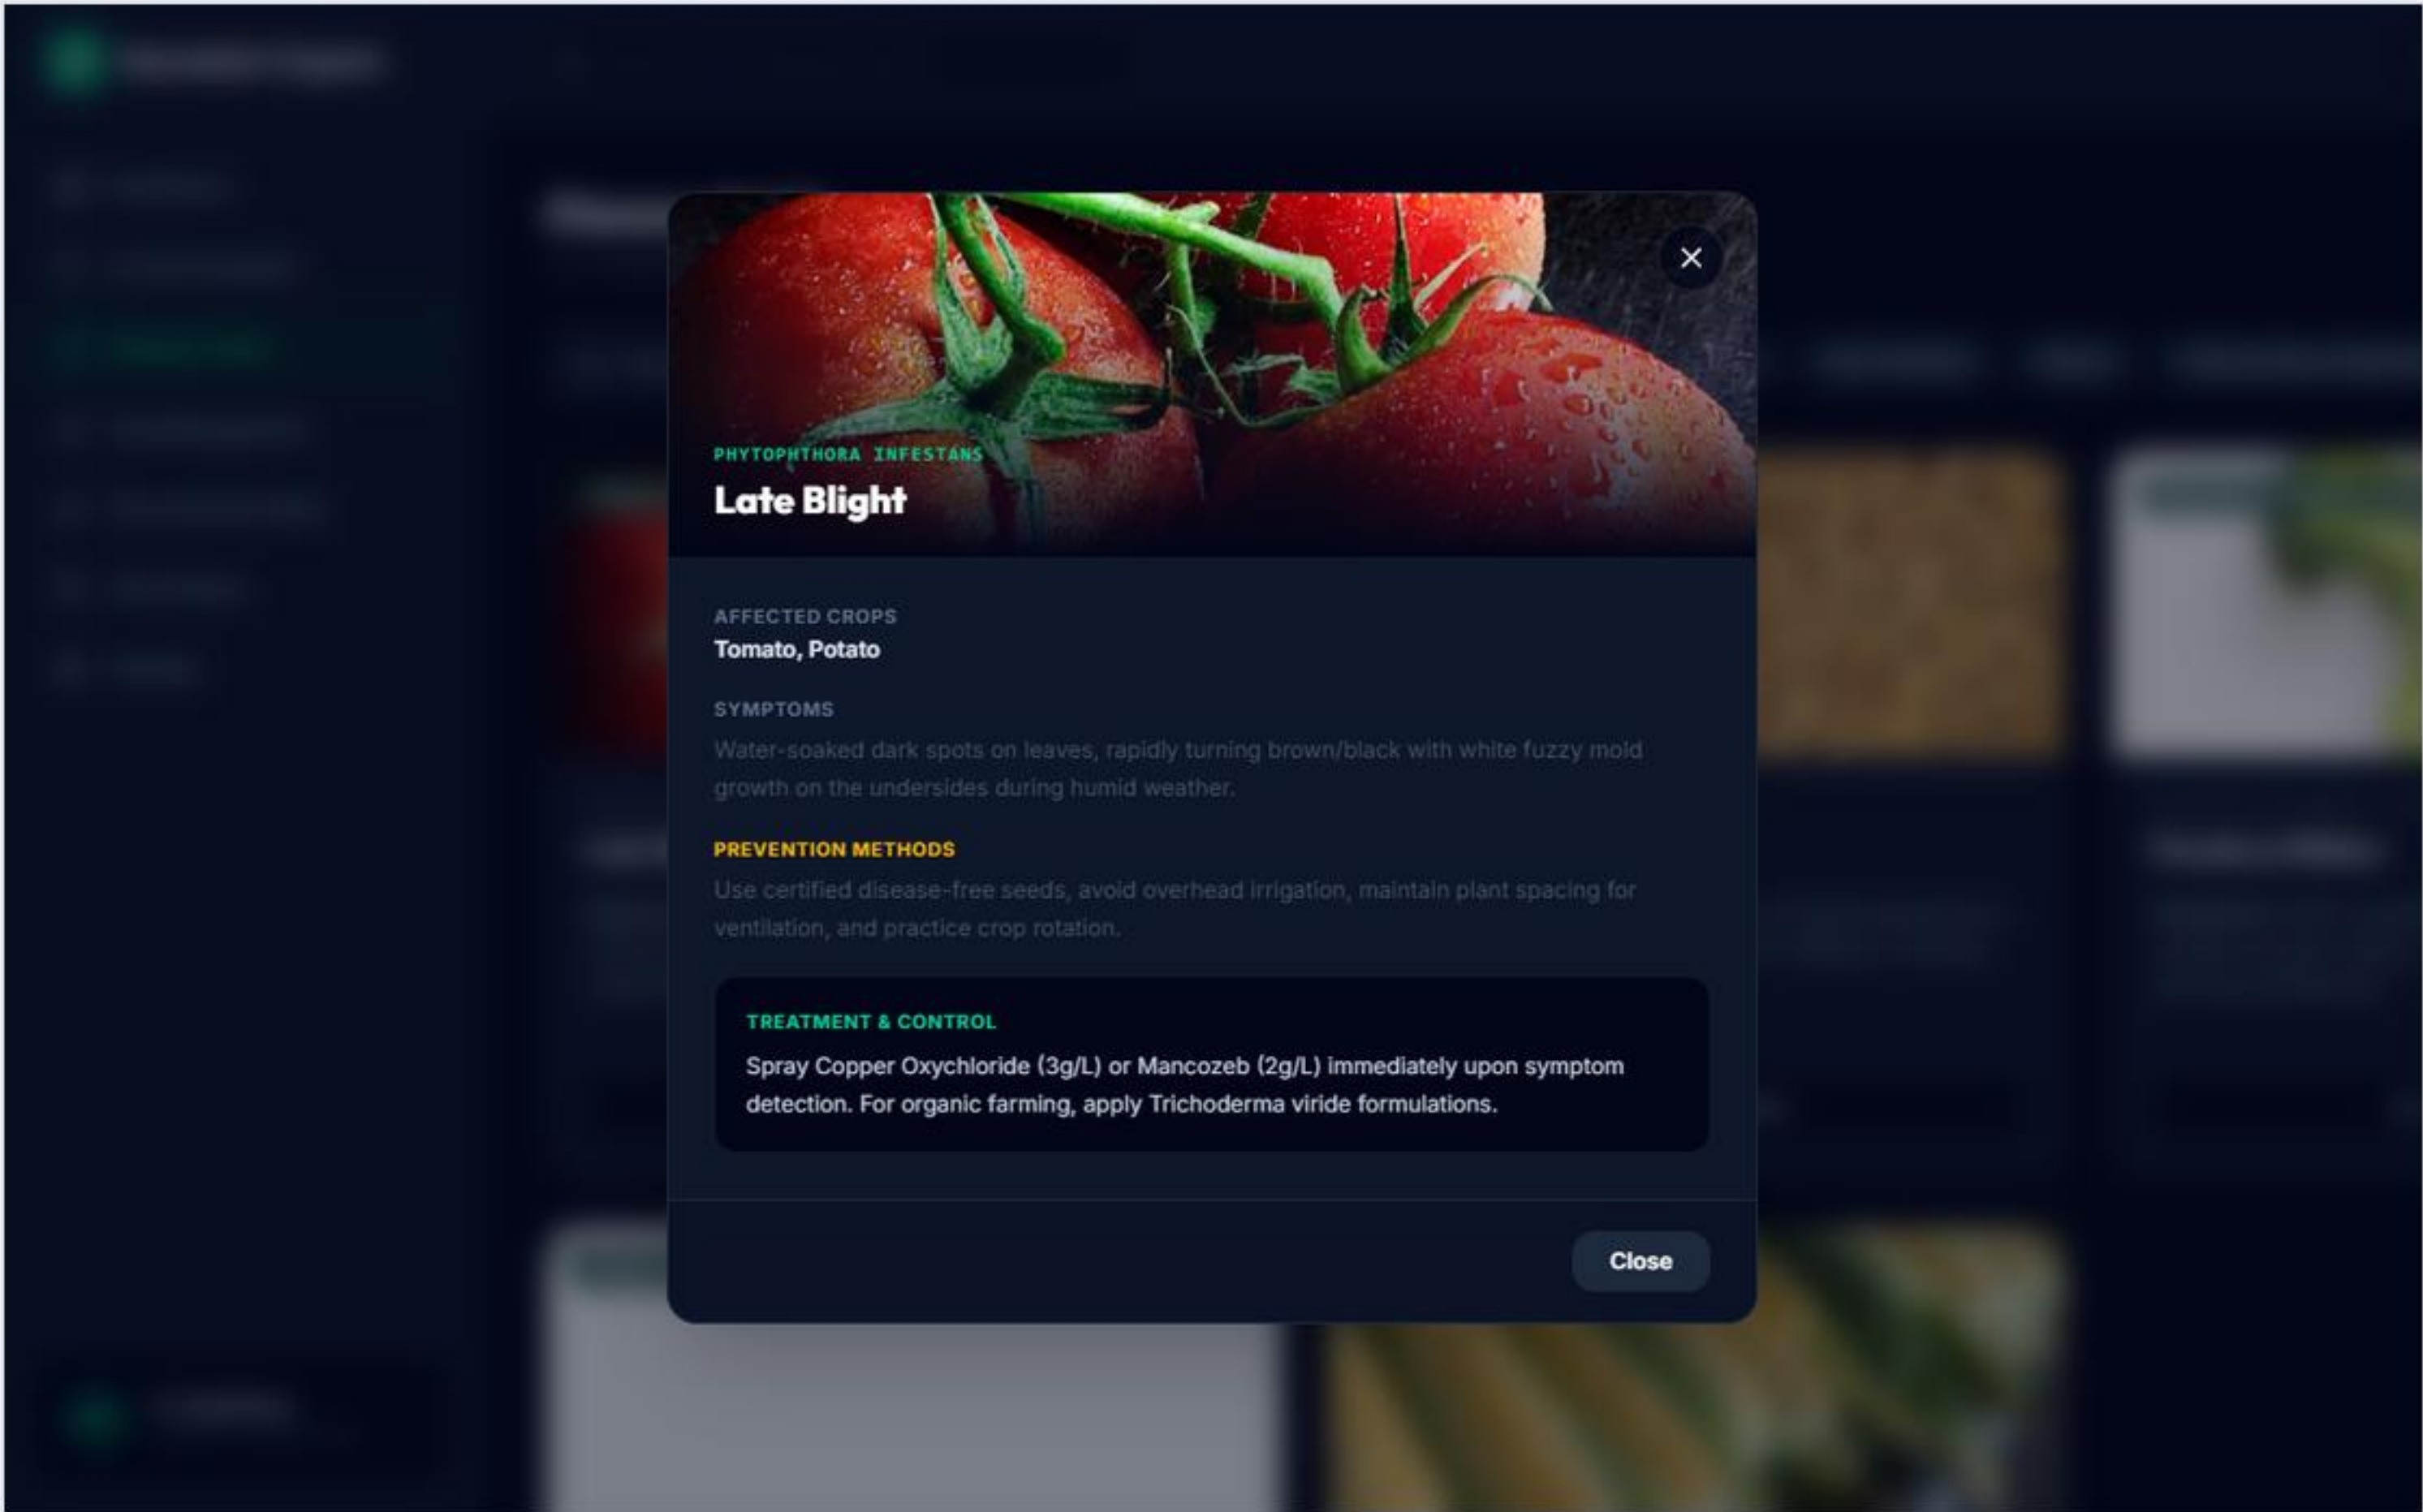

1. CREATE Operation - Persisting Chat Session

CAPTION & ANALYSIS:

Headless browser automation initiates an AI advisory chat session querying 'How to control aphids?' and saves the conversation. The session is dynamically persisted to MongoDB Atlas, allocating a new session ID and storing all message structures.

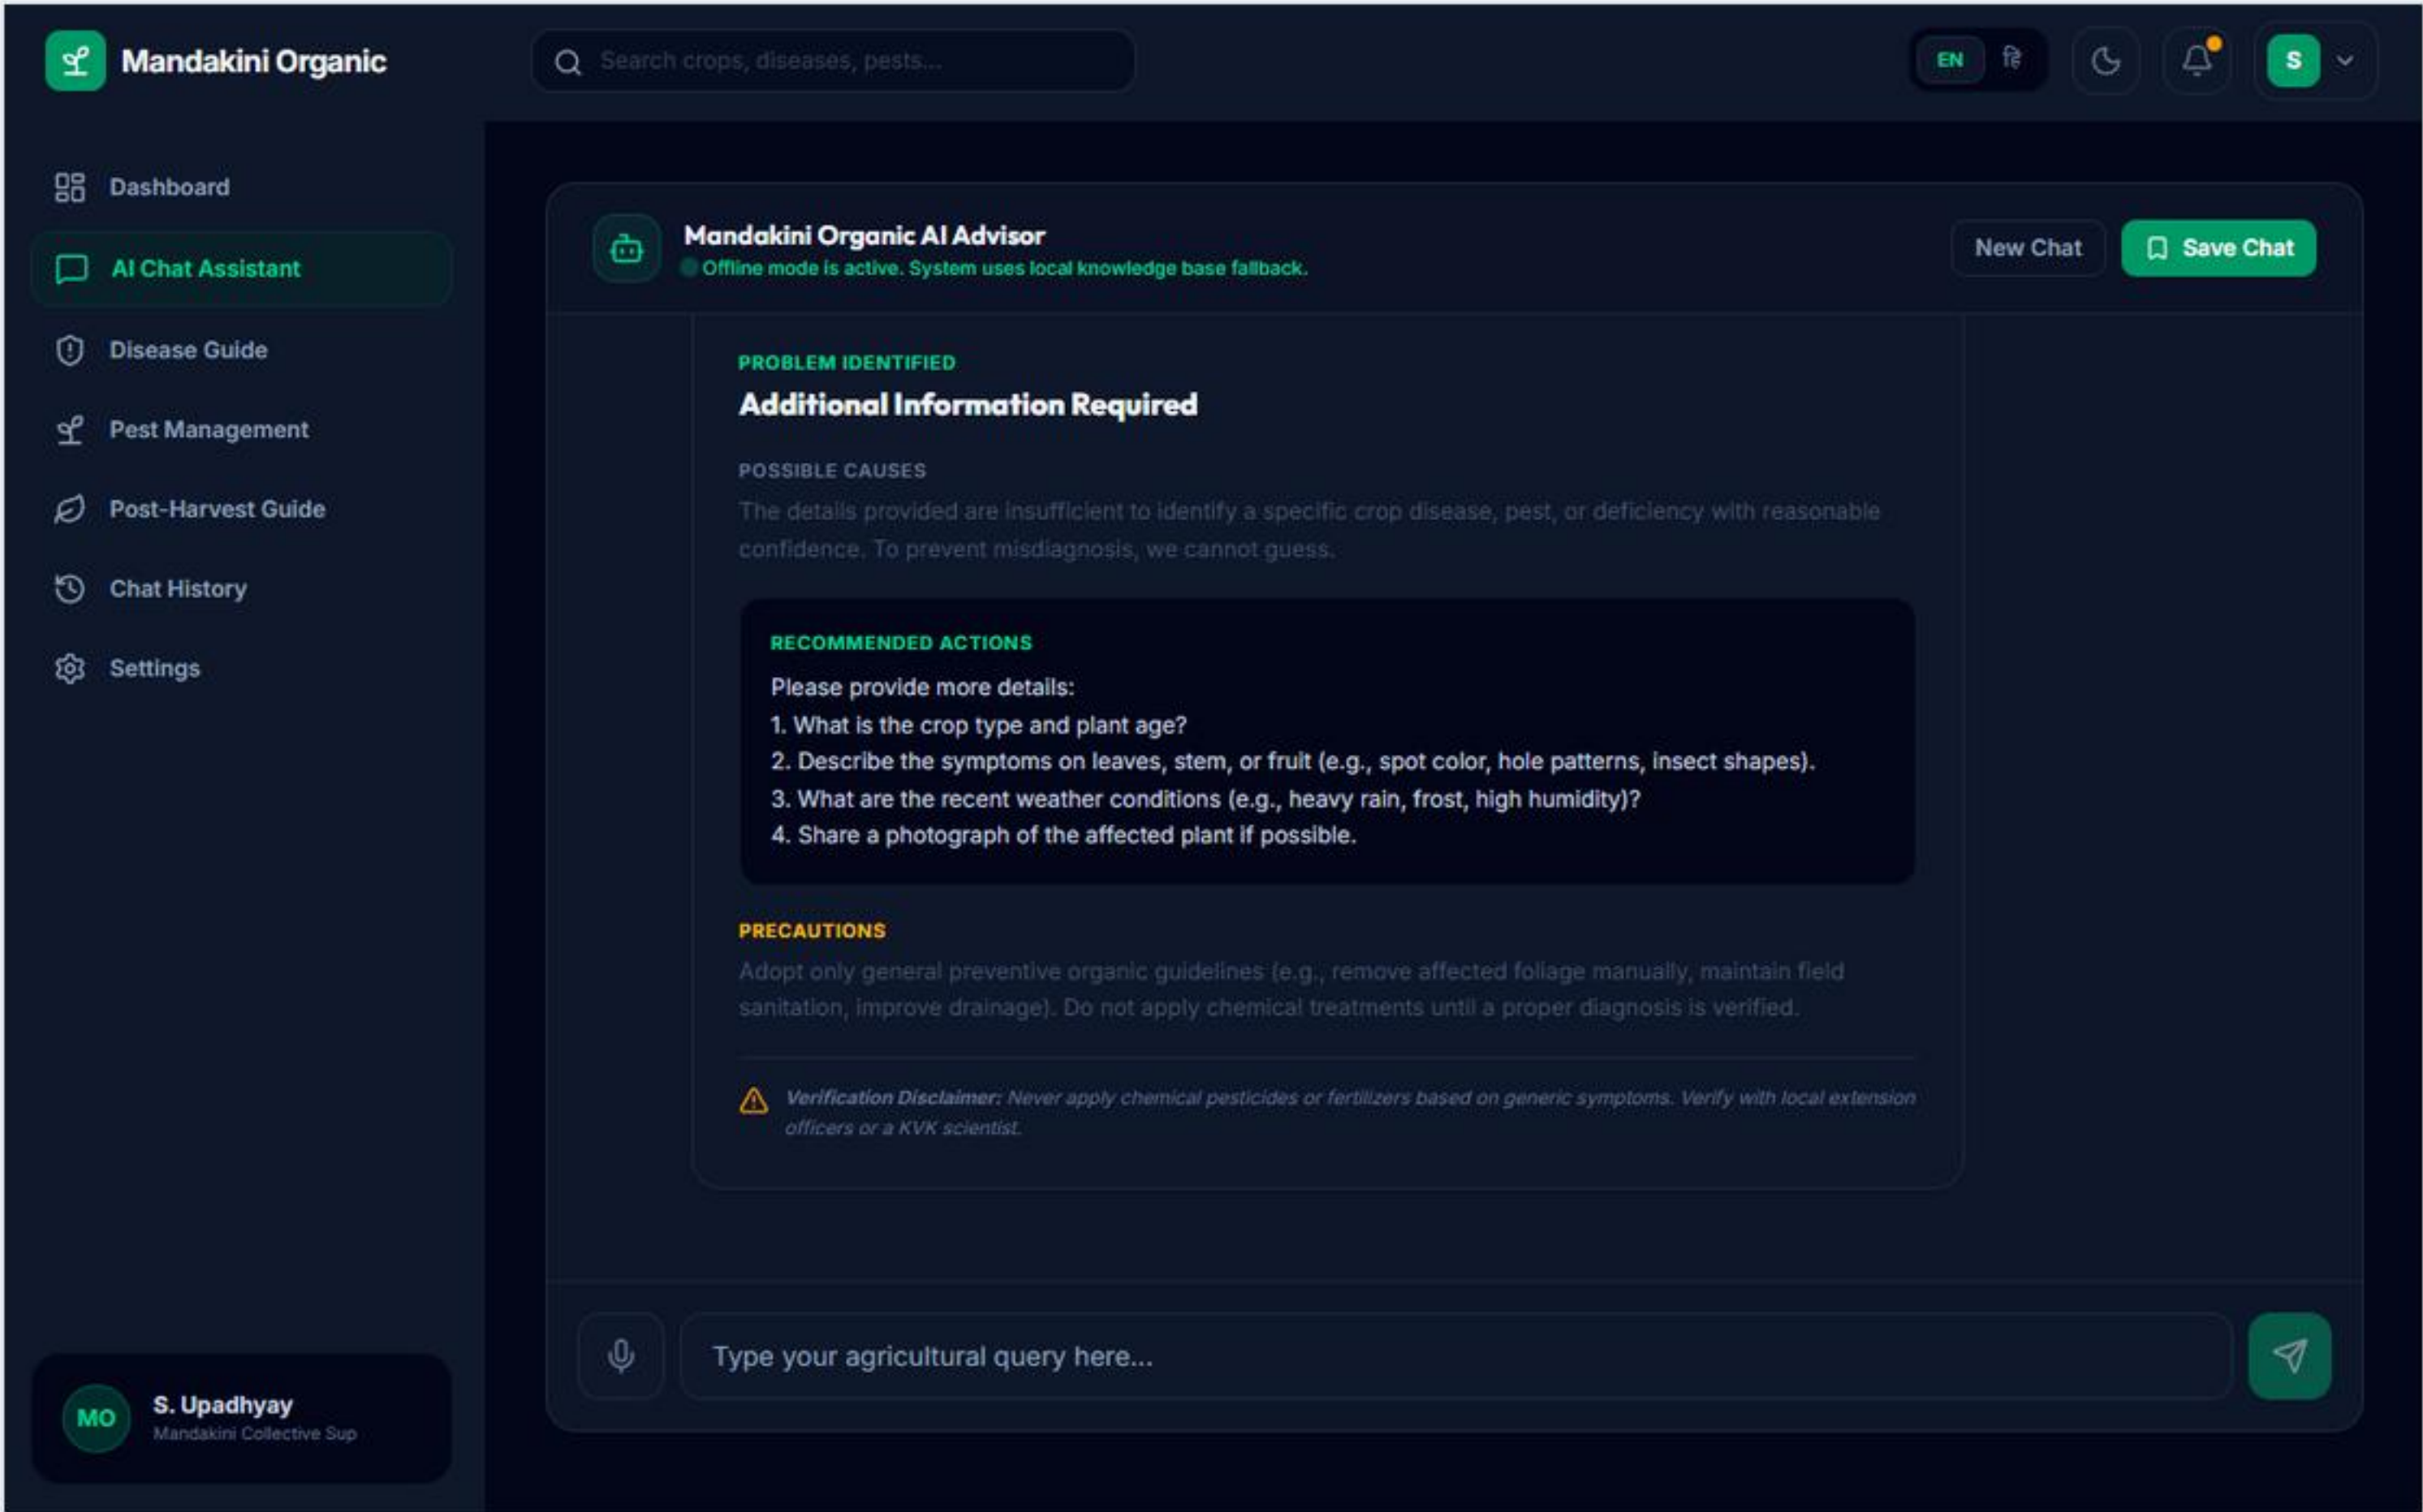

2. READ Operation - Fetching Guidelines & Details

CAPTION & ANALYSIS:

The supervisor navigates to the 'Disease Guide' view and opens the detailed advisory report for 'Late Blight' on Tomato, reading disease pathogen details, symptoms, prevention, and organic/chemical treatments queried from MongoDB.

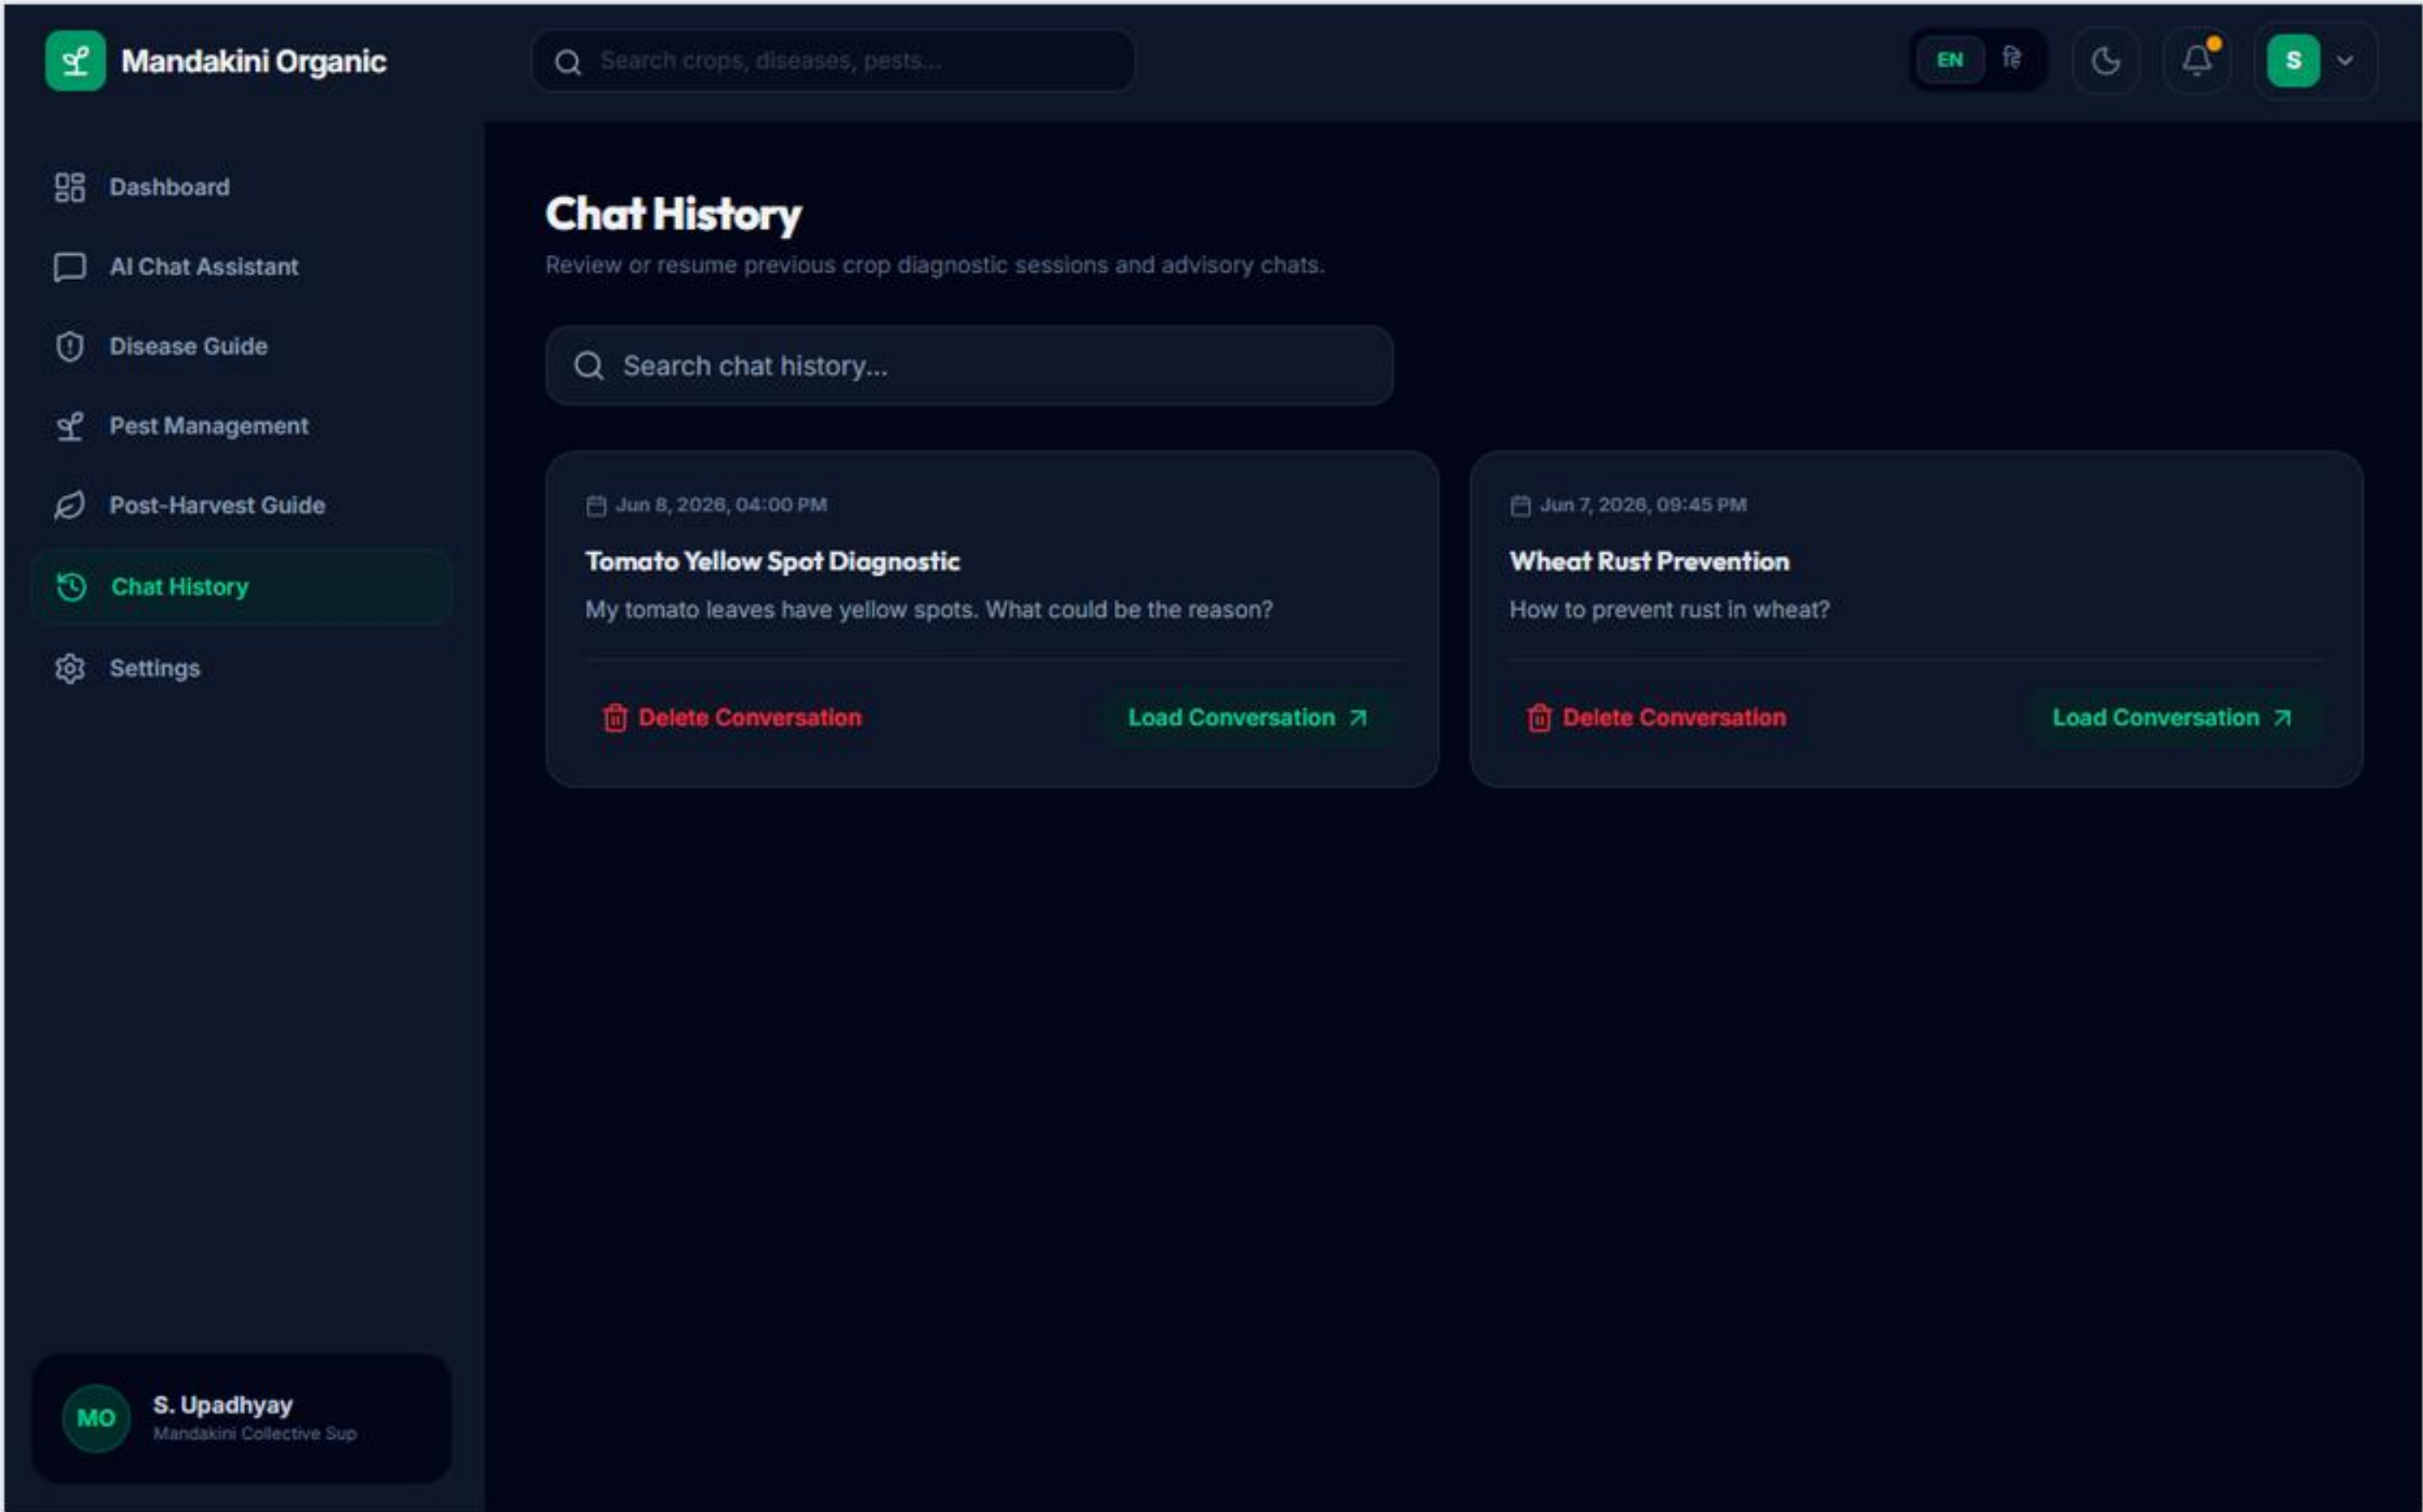

3. UPDATE Operation - Amending Chat History

CAPTION & ANALYSIS:

The supervisor sends a follow-up query 'What organic spray is best for them?' and re-saves the chat. The existing chat history record in MongoDB Atlas is successfully updated with the new message list, confirming that the update (UPSERT) logic is functional.

4. DELETE Operation - Removing Persisted Session

CAPTION & ANALYSIS:

The supervisor navigates to the 'Chat History' view and deletes the saved chat session. The backend issues a DELETE API call which successfully removes the document from MongoDB Atlas, leaving the history list empty as verified by the updated view.
